Service Information

CORRECTIONS TO THE SERVICE MANUAL

1. Service test program (page 25-26)

Flow chart drawing and test-descriptions on pages 25 and 26 have been updated to produced situation. Additional information to various test-modes has been added.

For corrected flow chart and descriptions see annex pages marked 25.a, 26.a and added page 26.1.

The most important corrections are:

Key-test : Correct key to enter the test is "MARK WRITE".

Hole-test : The test can only be entered if tray is in opened position. To move tray outside execute tray-test, first.

IR-test : RC5-Codes of TEXT and TIME have been exchanged.

RC5-Code for TIME should read "11", RC5-Code for TEXT should read "12".

2. Adjustment table (page 28)

Position number of potmeter for take-up torque should read 3280 instead of 3220.

For corrected adjustment table see annex page marked 28.a which replaces the original page 28.

3. Measuring points on Digital Board PCB5 (page 44)

Position of red layer shifted in the printing process. Most measuring points can hardly be located.

For corrected layout see annex page marked 44.a which replaces the original page 44.

4. Measuring points on Read/Write Board PCB7 (page 50-54)

Pinning of measuring connector 1706 has been stated wrong in the circuit diagram and component layout. Measuring points MP11 and MP12 on page 51 (circuit diagram) and page 54 (component layout) have to be corrected according to the left drawing.

5. Partslist RED1-tape transport (page 60)

Service codenumber correction:

Item 1023 capstan motor reads 4822 361 21646 instead of 4822 361 21506.

CHANGES IN COURSE OF PRODUCTION**1. Read/Write Board PCB7 (page 50-54)**

Component layout changed into production stage "5". See annex pages marked 54.1 and 54.2. Component layout as published on page 53 and 54 of the service manual is valid for production stages "3" and "4".

The different production stages can be identified by a twelve-figure number, located at the lower right corner of the

Read/Write printed circuit board (component-side view):

- "3103 303 3241.3" indicates production stage 3,
- "3103 303 3241.4" indicates production stage 4,
- "3103 303 3241.5" indicates production stage 5.

2. Replacement of Loading assembly "LDU1000" (4822 691 20833)

In course of production the temperature stability of the speed control circuit has been improved.

Following components have been changed:

- **Main board (PCB3)**: R3263 changed from 12k to 15k
- **DCC-indication board (PCB6)**: NTC-resistor in series to capstan motor changed to diode/resistor section parallel capstan motor (service manual shows already the new circuit).

When replacing the loading assembly by an earlier/later version only the built-in main board must be matched to the LDU1000 delivered. The DCC-indication board needs not to be adapted.

Replacement procedure:

- Replacing LDU1000 WT00 or WT01 by a WT02-version: Change R3263 from 12k to 15k!
- Replacing LDU1000 WT02 by a WT00 or WT01-version: Change R3263 from 15k to 12k!
- Adjust speed control as described on page 28 of service manual.
- Check take up torque and wow&flutter (for limits see page 28 of service manual).
- Adjust Dolby level (main board).

3. Software versions of front- and main-μP

The tables below give a survey of various software versions and introduction dates.

70DCC380	Front-μP (pos.7401)	Main-μP (pos.7335)
WK 9302	OTP v77 TMP87PM70F ¹⁾	OTP v77 P87C528EBPN ¹⁾

70DCC600	Front-μP (pos.7401)	Main-μP (pos.7335)
WK 9301	OTP v77 TMP87PM70F	OTP v76 P87C528EBPN ²⁾
WK 9303	OTP v77 TMP87PM70F	OTP v75 P87C528EBPN ³⁾
WK 9312	OTP v77 TMP87PM70F	OTP v72 P87C528EBPN ⁴⁾
WK 9320	OTP v77 TMP87PM70F	OTP v75 P87C528EBPN ³⁾
WK 9322	OTP v77 TMP87PM70F	OTP v72 P87C528EBPN ⁴⁾

1) OTP-versions are marked directly on the IC

2) OTP marked "5.1"

3) OTP marked "5.2"

4) OTP marked "5.2A"

Note: The software stages are numbered in decreasing order.
That means: The lower the number, the higher the software stage.

Because of compatibility problems the μPs cannot be mixed-up arbitrary.

In case of a defective μP always exchange both (front and main-μP) by their latest releases:

- Front-μP	version 67	4822 209 32528	TMP87CM70AF-6128
also available on complete mounted front board			
for 70DCC300		4822 214 52176	
for 70DCC380		4822 214 52177	
for 70DCC600		4822 214 52178	
- Main-μP	version 69	4822 209 32974	P83C528FBP/054

ADDITIONAL INFORMATION**1. Functional diagrams**

Functional diagrams for main-, digital- and read/write-board have been added. See annex, added pages 14.1, 14.2, 14.3, 14.4, 14.5, 14.6, 14.7, 14.8, 14.9 and 14.10.

SERVICE HINTS

1. Symptom : The set can't find the use-again marker on a customer recorded DCC (endless loops during append).

Cause : Crosstalk from WDATA to INAUX.

Cure : Cut off minus lead of ELCAP 2711 on Read/Write board.
Solder wire from minus lead of C2711 to pin11 of IC7703 (read amplifier TDA1317).

Remarks : The phenomenon is hardly reproducible and occurs only on printed circuit boards with production stage "4".
The different production stages can be identified by a twelve-figure number, located at the lower right corner of the Read/Write board (component-side view). "3103 303 3241.4" indicates production stage 4.

2. Symptom : Recording on DCC via digital input is not possible.

Cause : When recording from an external digital source, the system clock (256fs) has to be reconstructed from the digital EBU-signal. The accuracy of this frequency depends on the timing reference of the source player. In case this source is using a ceramic resonator with tolerances of ±0,5% the DCC-system has difficulties to follow this signal. The DCC-system can only compensate deviations of ±0,2% (length of the InterFrameGap "IFG"). That's why the DCC-set will not start the recording. The message "CHECK DIGITAL IN" is shown on the display.

Cure : Consult service information about resonator circuit of concerning source set.

3. Symptom : Transistor 7355 (BC817/40) of solenoid circuit defective.

Cure : Replace defective transistor (4822 130 42615).
Check soldering of diode 6308 (BAS16) on main board.
Check cooling of transistor 7205 (BD434) on main board.

Remarks : Insufficient pressure of transistor clips (item 512 in service manual 70DCC300) will cause an increasing supply voltage of the play magnet (voltage on solenoid ≥ 15V), which can destroy transistor 7355.

4. Symptom : Poor loading function – Slider opener (pos. 216-219 of exploded view) lands on top of cassette.

Cause : Shutter (pos. 552) out of form. Left side touches either on bracket (pos. 551) or controlling lever (pos. 556).

Cure : Bend left side of shutter so, that there is no contact to other parts (min. distance between pos. 551 and pos. 552 ≥ 0,1mm).

Remarks : Loading assembly, marked with a red cross on the top of bracket 551 has already been checked by the factory.

SOFTWARE BUGS 70DCC300 / 70DCC380 / 70DCC600

FUNCTION	SYMPTOM	SOLVED IN μP-VERSION
PLAYBACK	<i>The output level decreases from 2,2V to 1,5V after jump from a track with 44,1kHz sampling frequency to a track with 32kHz sampling frequency.</i>	F67 / M69
RECORD	<i>If the set detects "quick reverse" while writing a marker the software hangs up.</i>	F67 / M69
	<i>Wrong start positions of tracks and old recordings are audible during pause (occurs only after a few times append). ¹⁾</i>	F67 / M69
NEXT / PREV	<i>After next / previous the first 0,5 seconds of the selected track are missing.</i>	F77 / M72
	<i>Next mode doesn't work at the end of tape side A, previous mode doesn't work at the beginning of side B (occurs only if head position is within leader tape).</i>	F67 / M69
	<i>Set changes to side B in next mode arbitrarily. If two start markers are set very close to each other, they are detected as a reverse marker.</i>	F67 / M69
RENUMBER	<i>Wrong track numbering after renumber (e.g. tape with 2 tracks → erase 2nd start marker → start RENUMBER → start APPEND → track no. is "3" instead of "2").</i>	F67 / M69
	<i>Renumer stops on side B after detection of a reverse marker (only if area in front of the first start marker on side B is an user tape).</i>	F67 / M69
DISPLAY	<i>Incorrect display of time after append. ¹⁾</i>	F67 / M69
	<i>After loading an ACC the counter does not function (sometimes). The counter info remains "0000".</i>	F67 / M69
	<i>After message "TAPE FULL" the display is erased incorrectly ("...ULL" remains).</i>	F67 / M69
	<i>After message "TRACK REPEAT" the display info is not correct (the display shows e.g. ">>" instead of "PLAY").</i>	F67 / M69

¹⁾ These errors are caused by inaccurate headpositioning when rewriting the AUXILIARY-INFORMATION.
Upgraded software will only improve these functions for new recordings, but not solve problems with existing customer recorded tapes.

COMPATIBILITY PROBLEMS TO OTHER DCC-RECORDER

1. Symptom : A recording via ANALOGUE IN is made on a 70DCC900.

Copying the "master tape" from 70DCC900 to 70DCC300 / 70DCC380 / 70DCC600 is correct.

Copying the same master tape from 70DCC300 / 70DCC380 / 70DCC600 to 70DCC900 is prohibited.

If the first recording is made on the 70DCC300 / 70DCC380 / 70DCC600 the master tape can be copied in both directions.

Cause : The sysinfo-header of the 70DCC900 master tape (where the SCMS-information is located) is misinterpreted by the 70DCC300 / 70DCC380 / 70DCC600 software. Due to this misinterpretation the copyright status on the digital output toggles between "prohibit coded" and not.

Cure : Upgrade both μPs (front- and main-μP) to their latest releases:

– Front-μP version 67 4822 209 32528 TMP87CM70AF-6128

also available on complete mounted front board

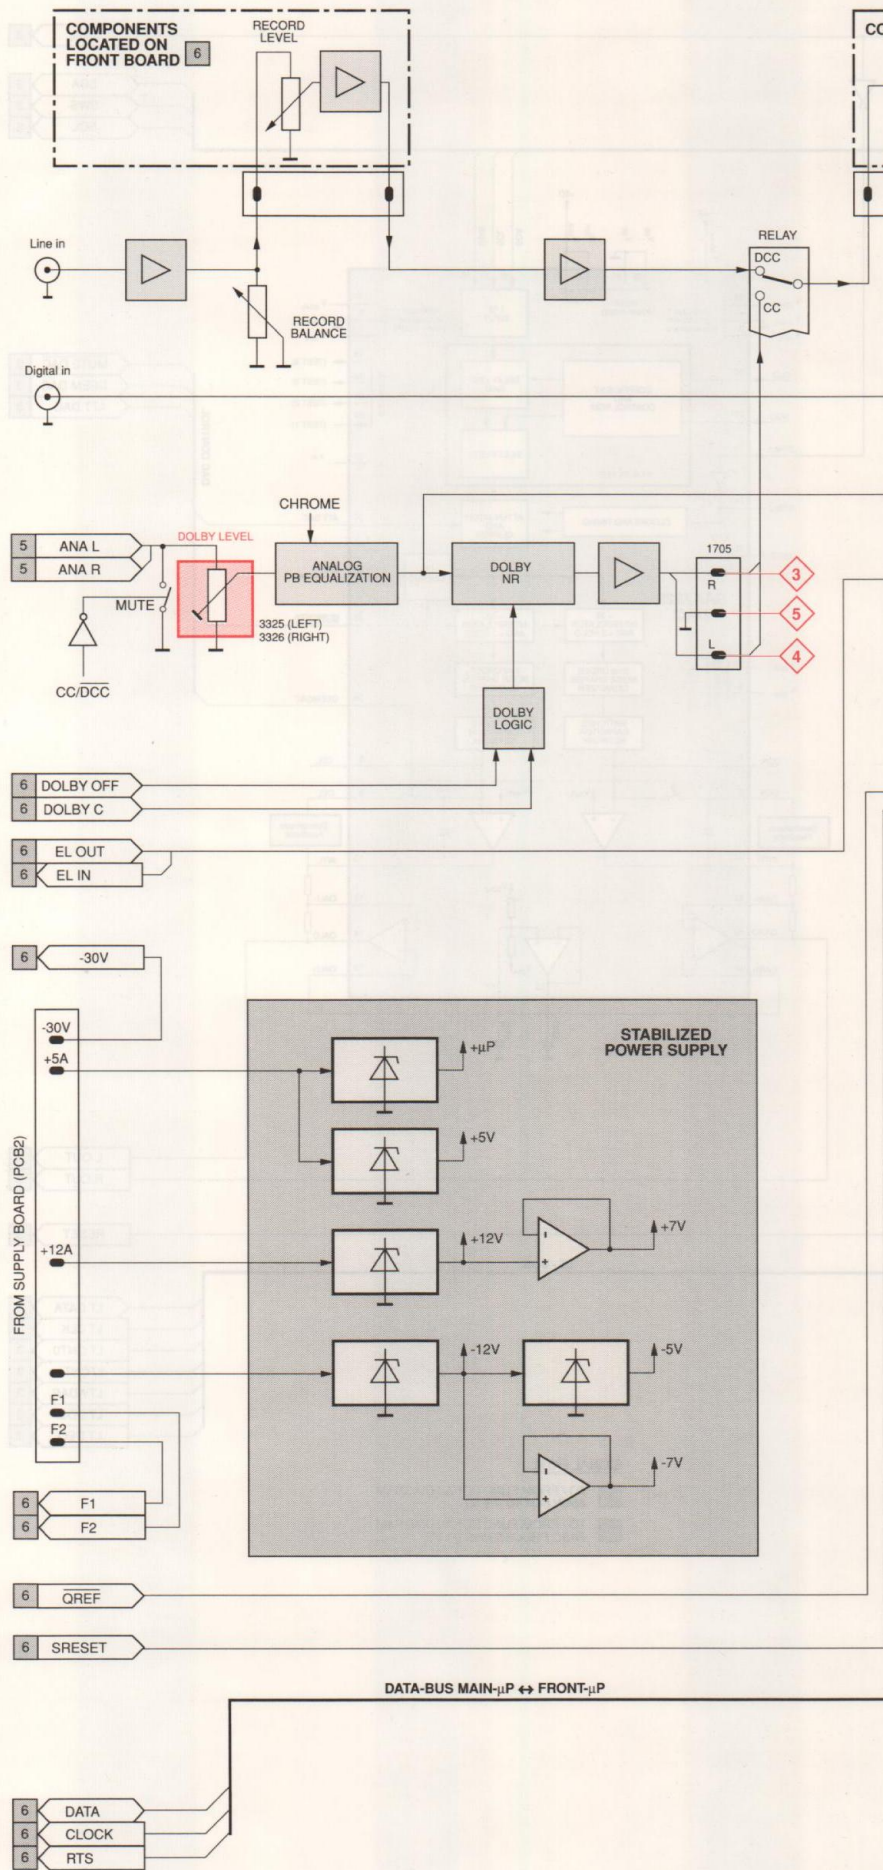

for 70DCC300 4822 214 52176

for 70DCC380 4822 214 52177

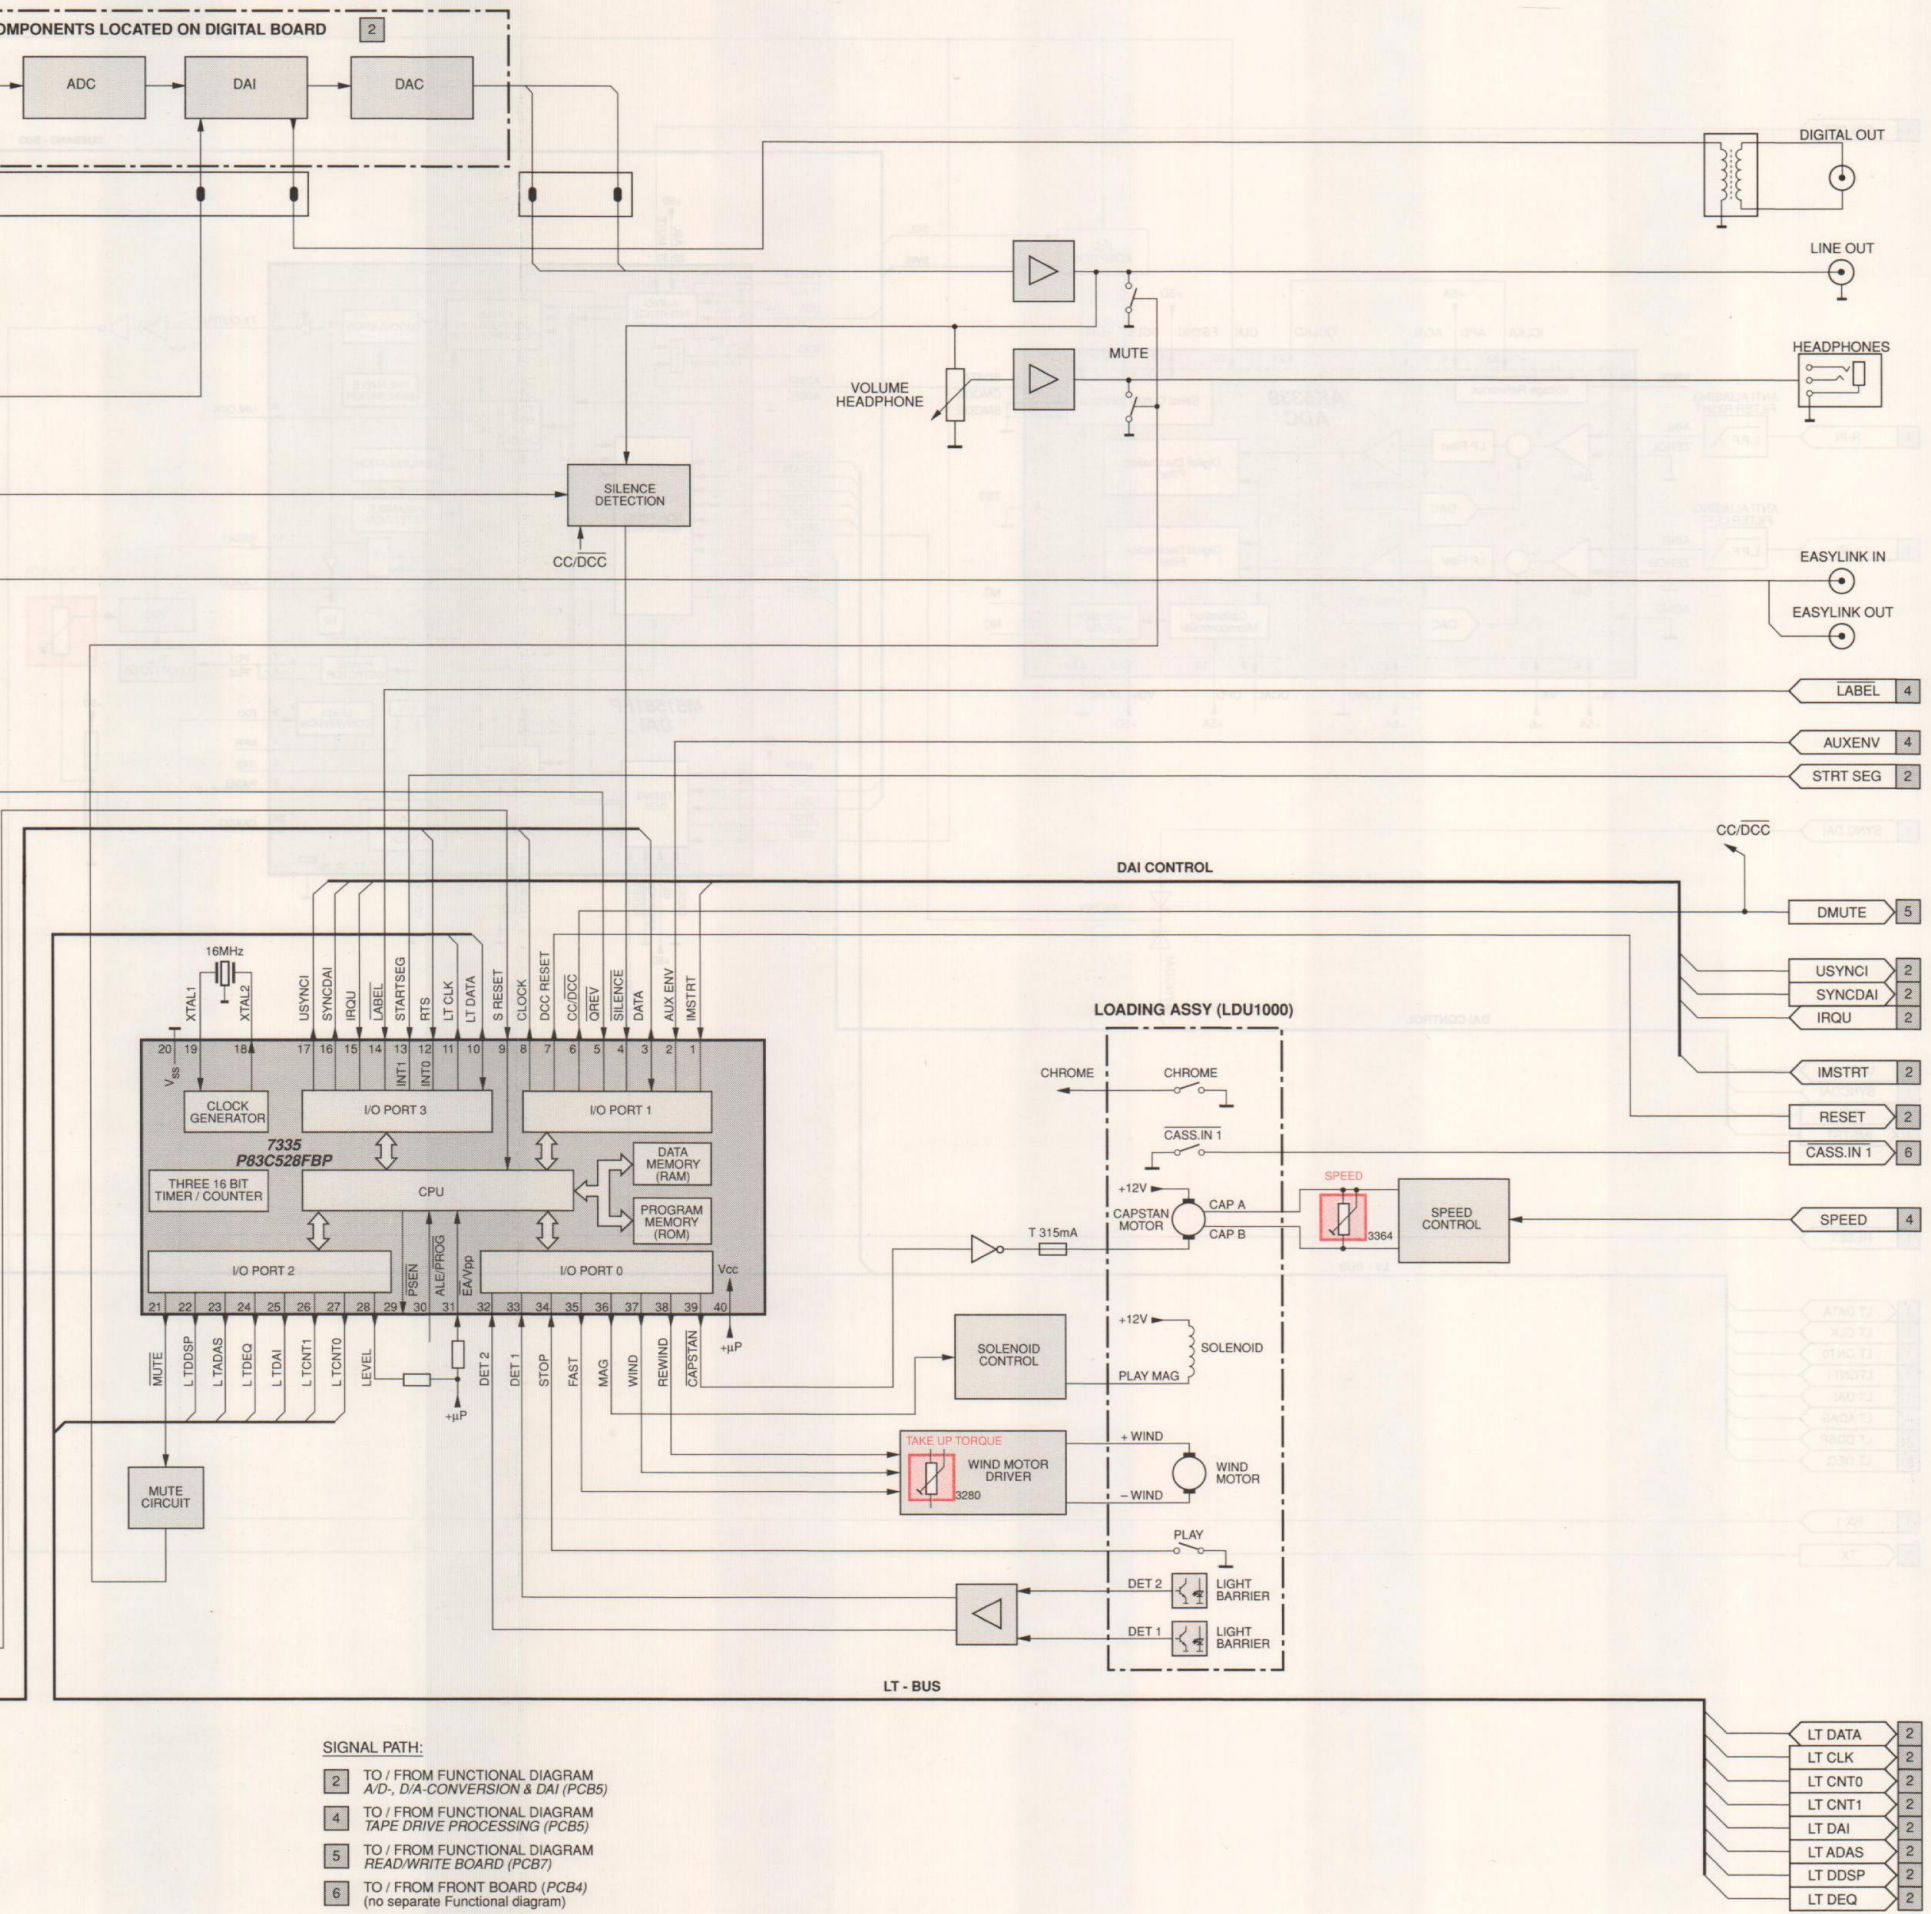

for 70DCC600 4822 214 52178

– Main-μP version 69 4822 209 32974 P83C528FBP/054

SERVICE TEST PROGRAM - FLOW CHART

¹⁾ only useful with special measurement equipment
²⁾ only for versions with IR-remote control

SERVICE TEST PROGRAM – DESCRIPTIONS

1. GENERAL

The test program is equipped with a service mode, a factory mode and an extended playback-mode.
 – The service mode includes tests for display, detection of hole switches IR-remote and keys.
 – The factory mode is a special test program, which is used in the production process of the front board, but not useful for service purposes.
 – In the extended playback-mode the error rates (C1 error flags from DDSP) are shown on the display. Also the tape channel for the digital eye output of the DEQ2 (pin1) can be selected.

2. EXTENDED PLAYMODE

– Turn POWER ON.
 – Insert a DCC
 – Hold DOLBY B/C & REC.PAUSE buttons depressed, then press PLAY.

The set is now in the extended playmode, music will be audible. The C1-error flags, detected by the ERCO, are read out via the LT-interface of the DDSP.

– The display shows “x yy zz ffff”.
 “x” indicates the selected tape channel
 “yy” indicates the error rate of channel (x-1) in %.
 “zz” indicates the error rate of channel x in %.
 “ffff” counts the number of tape blocks received without C1-error.

Because of software reasons the error rate per channel can only be indicated in steps of 5%. In normal operating sets and excellent tape material the error rates will (due to the rough resolution) always be “0”. A much better indication for the quality of data gives the tape block counter (“ffff”). If the count is resetted just every minute the signal processing path should be OK. In case of too high error rates (frequent resets) check the signalflow DCC head → read amplifier → DEQ → DDSP (especially RDMUX).

– Press the TIME button to increase x by steps of 2.
 – To exit the extended playmode press the STOP button.

3. SERVICE MODE

– Turn POWER ON
 – Remove cassette from the cassette compartment.
 – Hold DOLBY B/C & REC.PAUSE buttons depressed, then press PLAY.
 – The display shows “SERVMODE Vxx”.
 “xx” indicates the software version of the front-µP.
 – To enter servicemode press the NEXT button.
 – The display shows “SERVICE MODE”.

The available tests can now be entered by pressing the corresp. buttons (see also flow chart on previous page).

– To exit the service mode press the STOP button.

3.1. DISPLAY SOFTWARE VERSION OF MAIN-µP

– To display the software version of the main-µP enter service mode and press the TIME button.
 – The display shows “MAINVERS Vxx”.
 “xx” indicates the software version.
 – To exit this test press the STOP button.

3.2. DISPLAY TEST

– To start the display test enter service mode and press the DIGITAL/ANALOGUE button.
 – The display shows “DISPLAY TEST”.

Four display test pattern are available (see fig. 1-4). The patterns can be scrolled forwards resp. backwards by pressing the WIND resp. REWIND button.

– To exit the display test press the STOP button.

fig.1

fig.2

fig.3

fig.4

3.3. KEY TEST

– To start the key test enter service mode and press the MARK WRITE button.
 – The display shows “KEY TEST xx”.
 – “xx” indicates the key-number.

Press keys and check their corresponding key-numbers according to table 1.

KEY	KEY NUMBER	KEY	KEY NUMBER
RENUMBER	01	RECORD	27
OPEN/CLOSE	03	DOLBY B/C	33
WRITE MARK	05	BACKWARD	35
PREVIOUS	09	CD SYNCHRO	37
APPEND	11	REPEAT	39
DIGITAL/ANALOGUE	17	SIDE A/B	41
FORWARD	19	RECORD/PAUSE	43
ERASE MARK	21	TEXT	65
PLAY	23	TIME	67
NEXT	25	RESET	73

table1

– To exit the key test press the STOP button.

3.4. IR-TEST

– To start the IR-test enter service mode and press the DOLDY B/C button.
 – The display shows “IRTST xx/yyy”.
 “xx” indicates the system code (DCC=23)
 “yyy” indicates the command code

Press keys and check their corresponding system/command code according to table 2.

SYSTEM-CODE 23 (DCC)			
KEY	COMMAND-CODE	KEY	COMMAND-CODE
0	00	PREVIOUS	33
1	01	RECORD MUTE	42
2	02	OPEN/CLOSE	45
3	03	SIDE A/B	47
4	04	RECORD PAUSE	48
5	05	RESET	49
6	06	BACKWARD	50
7	07	FORWARD	52
8	08	PLAY	53
9	09	STOP	54
TIME	11	RECORD	55
STAND BY	12	MARK WRITE	114
REPEAT	28	APPEND	117
NEXT	32	TEXT	122

table 2

– To exit the IR-test press the STOP button.

3.5. HOLE TEST

Note: The hole test can only be entered when the tray is in opened position. To move tray outside execute tray test, first.

– To start the hole test enter service mode and press the RECORD button.
 – The display shows “HOLE TEST”. Hold indication switch x depressed and check display.

DCC-INDICATION BOARD (PCB 6)

If detection of holes is OK the display shows e.g. “HOLE 1 OK”, else “HOLE TEST”.

– To exit the hole test press the STOP button.

3.6. TRAY TEST

The tray test is mainly intended to check the end stop switches 1436/1437, located on the tray indication board (PCB 0, page 57).
 – To start the tray test enter service mode and press the APPEND button.
 – The display shows “TRAY TEST”.
 – Press the OPEN/CLOSE button.

If tray end stop switches are OK the display shows “OPEN OK” resp. “CLOSE OK”, else “OPEN ERROR” resp. “CLOSE ERROR”.

– To exit the tray test press the STOP button.

3.7. LT-BUS CHECK

This test checks the communication between DEQ2, DDSP, ADAS/SBC and main-µP. The test program sends settings via the LT-Bus to the selected IC, and checks if these settings have been received / can be read out correctly.

– To start the LT-bus check enter service mode and press the TEXT-button.
 – The display shows “LT-CHECK”
 – Press the WIND button.
 – The DEQ will be checked, the display shows “DEQ CHECK”.
 – After approx. 1sec. the result is shown on the display.

If the communication via LT-interface is correct the display shows “DEQ OK”, else “DEQ ERROR”.

– To test the communication to the other ICs press the WIND resp. REWIND button.
 – To exit the LT-bus check press the STOP button.

ENGINEERS REMARKS

3.2. TRAY TEST
 To start the IR test enter service mode and press the DOLBY B/C button.
 The display shows "TRST xxVvY".
 "xx" indicates the system code (DCC=23)
 "VvY" indicates the command code.
 Press keys and check that corresponding system command code according to table 3.2.1.1.1.

3.3. HOLE TEST
 Note: The hole test can only be entered when the tray is in closed position. To move tray outside execute tray test first.
 To start the hole test enter service mode and press the RECORD button.
 The display shows "HOLE TEST". Hold indicator switch x depressed and check display.

If detection of holes OK the display shows "HOLE +OK" see HOLE TEST.
 To exit the hole test press the STOP button.

START-UP PROCEDURE

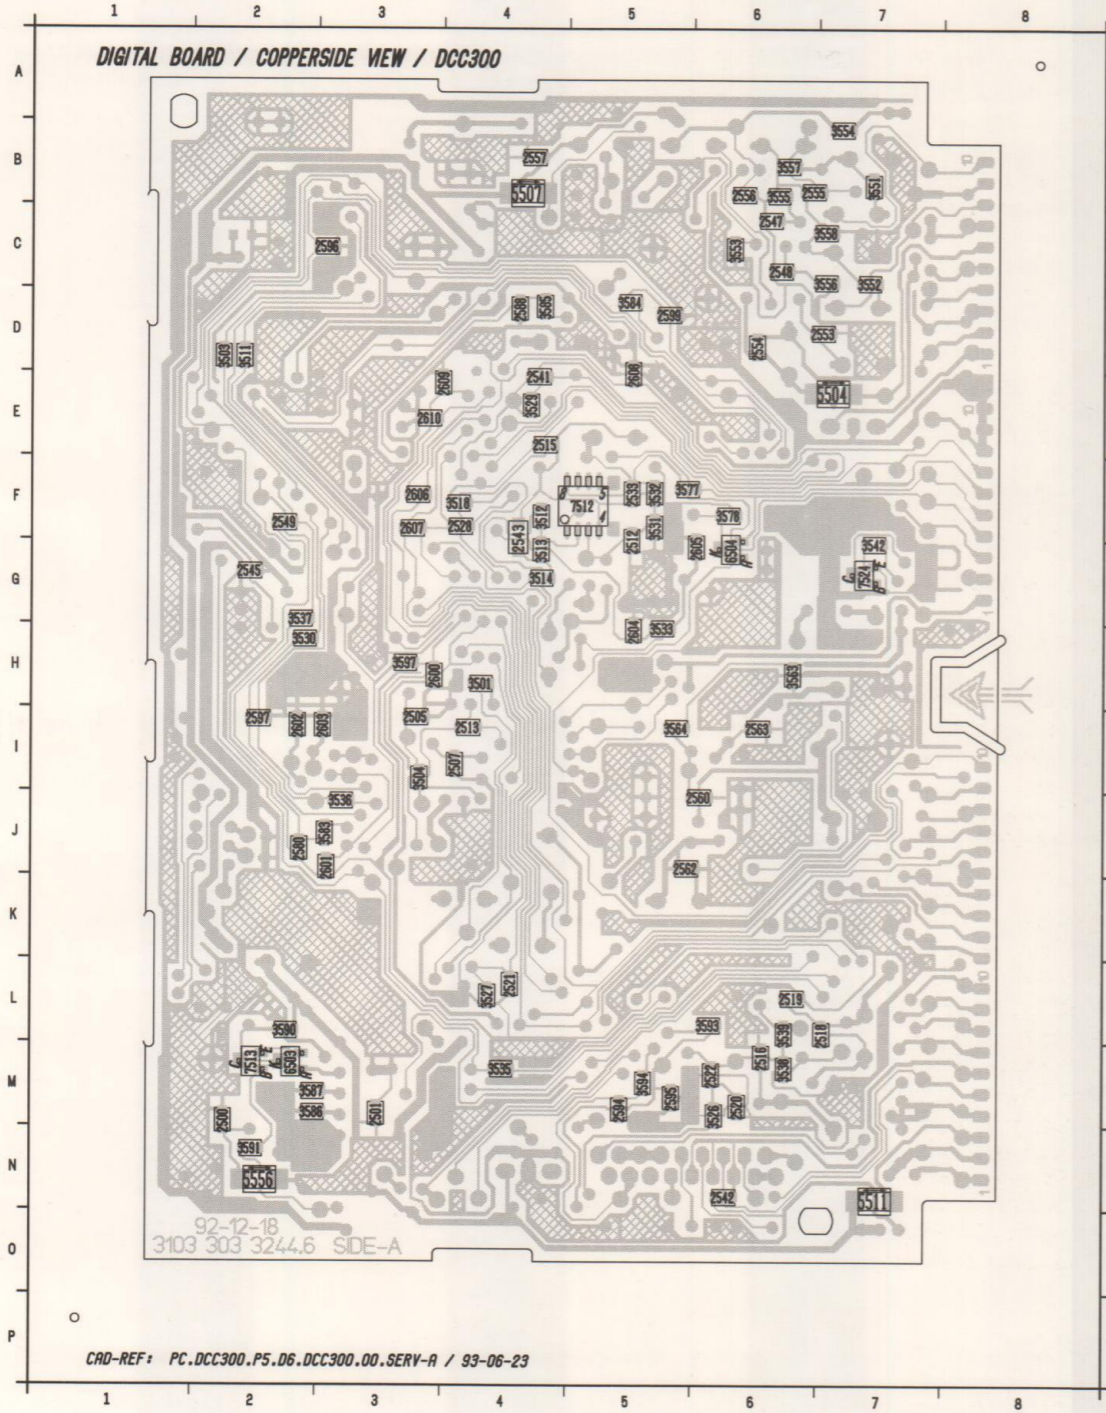

- Prerec. DCC: Atime, Rtime, TOC, TNo, TEXT
- Super user tape: Atime, Rtime*, TNo*
- User tape: Rtime*, TNo*
- * only if possible

ADJUSTMENT TABLE

	REMARKS				
TAPE SPEED					
Use test cassette "SBC420" 3150Hz (4822 397 30071)		1 2 main board	3264	Adjust to f = 3130..3140Hz	
TAKE UP TORQUE					
Use tourque measurem. cass. "811CTM" (4822 395 30054)		main board	3280	Adjust to 40..50g-cm	
WOW AND FLUTTER					
Use test cassette "SBC420" 3150Hz (4822 397 30071)		1 2 main board	check only	< 0,15% wtd.	
ANALOG FEEDBACK LEVEL AND BIAS					
Use test cassette "SBC420" 1kHz -10dB (4822 397 30071)	Set feedback pots 3729(left) and 3730(right) to max. output level first	6 7 8 read/write board	3739 (left) 3740 (right)	Adjust both channels to min. THD (target <2%)	
		6 7 8 read/write board	3729 (left) 3730 (right)	Decrease measured output level by 10dB	
DOLBY LEVEL					
Use Dolby reference cassette	Dolby ref. level 200nWb/m	3 4 5 main board	3325 (left) 3326 (right)	Adjust both channels to 620mV ±40mV Check: level meter shows -6dB	
RDMUX-LEVEL *					
Use 9,6kHz calibration cassette		9 10 read/write board	check only	1,2Vpp ±100mV	
RECORDING CURRENT *					
		11 12 read/write board			
PLL-FREQUENCY					
	Disconnect cable from digital-in plug, switch to RECORD PAUSE (digital source)	13 58 digital board	3550	Use counter, adjust to 7,25MHz ±0,15/-0MHz	

* Adjustments can not be carried out in repair shops. Read also adjustment remarks on page 29

SERVICE HINT

SYMPTOM : When the cassette is lifted at the left side, in order to remove it from the opened tray, the cassette gets stuck behind the front.

CAUSE : The drawer (pos. 209) does not open far enough, because the tray-out switch (pos. 1437) is actuated too early.

CURE : The switch is opened/closed by a ridge, located at the back righthand corner of the drawer. To delay the switch actuation cut off some plastic of the ridge according to the sketch below.

REMARK : This modification also takes an influence on the feature "touch to close". If too much plastic is removed the tray might already close while a cassette is inserted ! Try to find an optimal compromise.

REPLACEMENT OF THE DCC-HEAD

As already stated in the service manual the DCC-head cannot be replaced without special adjustment tools. In case of defective heads or write amplifiers the complete loading assy has to be sent to Philips Consumer Service for repair and adjustment of the recording current. Loose DCC-heads are not supplied. The service codenumber of the DCC-head, published in the partslist of the RED1 tape transport (page 60), has been referred to the service code of the complete loading assembly (4822 691 20833).

CORRECTIONS TO THE SERVICE MANUAL

- Partslist of RED1 tape transport (page 60)
Service codenumber of capstan motor, item 1023, should read 4822 361 21646.
- Partslist of digital board PCB5 (page 74)
Service codenumber of A/D-converter AK5339, item 7514, should read 4822 209 33849.

SERVICE TOOLS

- Dolby testcassette MTT-150 is available under service codenumber 4822 397 30271, Dolby testcassette TCC-130 via codenumber 4822 397 30269. With one of these cassettes the Dolby adjustment can be achieved.
- The DCC cleaning cassette SBC3500 is available under service codenumber 4822 015 20646.
